☞ Note: there will be short evening lectures at each overnight location, as appropriate.

国立公園の基本情報

KHEAUN SRI NAKHARIN NATIONAL PARK

Size: 1,534 square kilometers.

Established: 1981.

Located: Kanchanaburi Province in western Thailand.

The multi-tiered Huai Kamin Waterfall and the large Sri Nakharin Reservoir are popular attractions. The Phra Cave contains a towering Buddha statue installed hundreds of years ago and chambers which in the 18th century sheltered Thais fleeing Burmese invaders.

Some large mammals may live among the limestone hills of the Tenasserim Range and the bird life includes parakeets, kingfishers, bee-eaters, barbets, and orioles. Among 18 confirmed mammal species are the leopard cat, slow loris, civets, squirrels and bats.

The park is a good buffer for the superb Huai Kha Khaeng Wildlife Sanctuary to the north, but in the park itself one is more likely to see domestic cattle than wildlife. Karen villages are present, slash-and-burn agriculture is practiced and influential people get away with grazing their cattle within park boundaries. The reservoir affords easy access to hunters and illegal collectors of bamboo and other forest products. About 30 percent of park is degraded forest, agricultural land or water.

Topography

The limestone mountains of the Park are covered in evergreen and deciduous forests, the origin of Kwaie Yai River.

Climate

The area generally has high humidity in the air; more rain each year; and approximately temperature 28.8 degrees Celsius with the lowest temperature in December about 8 degrees Celsius. There are nicely cold all the year round.

Flora and Fauna

Abundant wildlife includes leopard cat, slow loris, civets, squirrels and bats. Birds found in the Park include parakeets, kingfishers, beeaters, orioles and barbets. The north side of the reservoir is an important fishing area for locals.
